

# Sprint Retrospective: Sprint 2

## What went well in this Sprint

- Given the demand from other courses such as midterms and assignments, we did a good amount of work that allows us to finish the rest of the backlog items in the next sprint
- We covered “all” the technologies that were initially identified as possible challenges such as implementing an image file system, Stripe API, Google Directions and Autocomplete places API and using JWT to track Business Owners
- Much improved punctuality for meetings
- All of us have our own independent working environments (Google Pixel Emulator, SQL database)
- Referred to the daily update template to better inform one another regarding status details
- All tasks started as soon as possible which gives us time to prepare for the C01 midterm which was towards the end of the sprint
- Finished the main functionality of the user features

## What did not went well in this Sprint

- During certain moments (when other responsibilities became more demanding), quality of daily updates decreased
- Certain PRs were reverting implemented features
- PR description sometimes needs to be more specific.
- Certain JIRA item statuses were not updated real-time

## What to do different for the next Sprint

- We can hold each other accountable for better daily updates
- Always self-review your PR to check for unwanted file changes
- Mandatory UI screenshots of feature implemented under PR description/comment
- Be more active in updating JIRA statuses
